## Introduction

WHM API 1 outputs data in either JSON or XML format. The output format depends on the options that you choose when you call the function.

- We **strongly** recommend that you use [JavaScript Object Notation \(JSON\)](#).
- [Extensible Markup Language \(XML\)](#) requires additional computational resources, and has complex requirements that can cause difficulty during the development process. This API's XML output is **not** compliant with XML standards, and it may result in validation errors.

### Important:

cPanel & WHM version 66 **deprecated** XML output for cPanel API 1, cPanel API 2, UAPI, WHM API 0, and WHM API 1.

- Calls for XML API output will return a deprecation warning.
- We plan to remove XML output entirely in a future version of cPanel & WHM.

For more information, read our [cPanel Deprecation Plan](#) document ation.

## Basic return data

Both JSON and XML output return data as hashes or arrays of hashes. All WHM API 1 function output follows the following basic structure:

- A top-level hash contains the `data` and `metadata` hashes. In XML output, `<result>` tags wrap the top-level hash of output.
  - The `data` hash contains the function's output parameters.
  - The `metadata` hash contains the function's metadata parameters.

## Metadata

### Important:

- WHM API 1 function documentation does not include `metadata` parameters in the table of return parameter information.
- WHM API 1 calls via the command line do **not** return the metadata that other methods return if they experience errors that prevent a successful function run. To check for errors in code that calls WHM API 1 functions via the command line, validate the command line return for a nonzero exit code instead.

The `metadata` hash includes the following output parameters:

Metadata parameter	Type	Description	Possible values	Example
<code>version</code>	<i>integer</i>	The WHM API version.	For WHM API 1 functions, this value is <b>always</b> 1.	1
<code>reason</code>	<i>string</i>	A message of success, or a reason for failure.	<ul style="list-style-type: none"><li>OK</li><li>An error message.</li></ul>	OK

## WHM API 1 Basics

## About WHM API 1

WHM API 1 performs functions and accesses data in WHM.

result	Boolean	Whether the function succeeded.	<ul style="list-style-type: none"> <li>1 — Success.</li> <li>0 — Failure.</li> </ul>	1
command	string	The WHM API 1 function name.	Any WHM API 1 function's name.	listaccts

**Note:**  
 If the function returns a hash with a single key whose value is an array, the metadata will include the `payload_is_literal` output parameter with a value of 1. You will **only** receive this parameter when you call WHM API's `rename_mysql_database` or `rename_mysql_user` functions, or when you call certain UAPI functions via WHM API.

### Example

The `accountsummary` function's output is typical of WHM API 1 output:

JSONXML

- Guide to WHM API 1 — WHM API 1 accesses the WHM interface's features.
- WHM API 1 - Filter Output — You can use additional variables to filter WHM API 1 output.
- WHM API 1 - Sort Output — You can use additional variables to sort WHM API 1 output.
