

# Manage SSL Hosts

For cPanel & WHM version 60

(Home >> SSL/TLS >> Manage SSL Hosts)

- [Overview](#)
- [Shared SSL Certificate](#)
- [Disabled Shared SSL Certificates](#)
- [Installed SSL Hosts](#)
- [Additional documentation](#)

## Overview

The *Manage SSL Hosts* interface allows you to share and delete installed SSL certificates.

## Shared SSL Certificate

This section of WHM allows you to share an SSL certificate. Your customers can use a shared SSL certificate to access your website via the `mod_userdir` module. For more information about the `mod_userdir` module, read our [Apache mod\\_userdir Tweak](#) documentation.

To share an SSL certificate, select the desired certificate from the menu and click *Share*. The system will redirect you to a new interface that contains a confirmation message.

**Note:**

If the interface does not list any certificates, you **must** create and install a new SSL certificate. To create and install a new SSL certificate, use WHM's [Generate an SSL Certificate and Signing Request](#) interface (Home >> SSL/TLS >> Generate an SSL Certificate and Signing Request) and WHM's [Install an SSL Certificate on a Domain](#) interface (Home >> SSL/TLS >> Install a SSL Certificate on a Domain).

## Disabled Shared SSL Certificates

To disable a shared SSL certificate, click *Disable* next to the SSL certificate under the *Shared SSL Certificate* heading. The system will redirect you to a new interface with a confirmation message.

## Installed SSL Hosts

**Note**

To open a secure website and verify that its SSL certificate works, click the domain name under the *Domain* heading in the *Installed SSL Hosts* table.

The *Installed SSL Hosts* table displays the domains with installed SSL certificates as well as the domains' information.

The following table describes the *Installed SSL Hosts* section:

Column	Description
<i>Domains</i>	The domain or domains that use the certificate.
<i>IP Address</i>	The IP address of the domain or domains.
<i>IP Address Type</i>	The type of IP address.
<i>Is Primary Website on IP Address?</i>	Whether the listed website is the primary domain for the listed IP address.
<i>Document Root</i>	The directory that contains the site's content.

<i>Owner</i>	The account for which you installed the key.
<i>Issuer</i>	The certificate's creation organization. If the certificate is self-signed, this column displays <i>self-signed</i> .
<i>Expires</i>	The certificate's expiration date.
<i>Key Size</i>	The length of the key's modulus, in bits.
<i>Is Mail SNI Enabled?</i>	Whether the certificate has Server Name Indication (SNI) enabled for mail services. Mail SNI configures the mail services to use the SSL certificate for your domain instead of the server's default certificate.
<i>Actions</i>	<ul style="list-style-type: none"> <li>• <i>Make Primary</i> — Click this link to make the website the main domain on the shared IP address.</li> <li>• <i>Delete</i> — Click this link to delete the certificate.</li> </ul>
