

Account Information

For cPanel & WHM version 60

([Home](#) >> [Account Information](#))

This set of features enables you to view information about your accounts, and provides a number of configuration options.

- [List Accounts](#) — This interface lists all of the accounts on your server. You can also perform certain actions on the listed accounts (for example, you can change the account's password).
- [List Parked Domains](#) — This interface lists all of the parked domains (aliases) on your server. A parked domain is a domain that points to another domain. To add parked domains, use the [Park a Domain](#) interface ([Home](#) >> [DNS Functions](#) >> [Park a Domain](#)).
- [List Subdomains](#) — This interface lists all of the subdomains on your server. Subdomains function as URLs for specific sections of a website (for example, the `example.com` domain may have the `blog.example.com` subdomain for its blog section). cPanel users can add subdomains in cPanel's [Subdomains](#) interface ([Home](#) >> [Domains](#) >> [Subdomains](#)).
- [List Suspended Accounts](#) — This interface lists any suspended accounts that are on your server, and enables you to unsuspend or terminate these accounts.
- [Show Accounts over Quota](#) — This interface lists the accounts on your server that currently use more disk space than you have allocated to the account. You can also use this interface to enter a new disk space quota for these users.
- [View Bandwidth Usage](#) — This interface displays information about your server's traffic from HTTP (browser traffic), FTP (files transferred), SMTP (sent mail), and POP3/IMAP (received mail).
