[Overview](#)

[How to update your cPanel & WHM software](#)

[Additional software updates](#)

[Additional documentation](#)

Overview

This feature allows you to update your cPanel & WHM software to the most recent build available on your server's Release Tier. For example, if you selected the CURRENT tier in WHM's [Update Preferences](#) interface (WHM >> Home >> Server Configuration >> Update Preferences), this feature will upgrade your server to the latest CURRENT build.

Notes:

- WHM displays the server's cPanel & WHM version in the top right corner of the interface. You can alternately run the `/usr/local/cpanel/cpanel -v` command to view version information.
- To see the latest available cPanel & WHM version in your chosen release tier, visit our [httpupdate](#) page.

How to update your cPanel & WHM software

To update your cPanel & WHM software, perform the following steps:

1. If you wish to force a reinstallation of the software, regardless of whether WHM detects that your system is up-to-date, select the appropriate checkbox. This can be useful if corrupt files exist and you wish to reinstall them.
2. Click [Click to Upgrade](#).

Notes:

- If you use Safari® on iPad, the browser may display text that is too small to read. To adjust the text size, use the iPad's zoom gesture.
- You can also run the `/scripts/upcp` script via the command line as the `root` user.

Additional software updates

The script that this feature runs (`/usr/local/cpanel/scripts/upcp`) calls other scripts in the `/usr/local/cpanel/scripts` directory that will update most of the software on your system.

The following table lists the additional scripts and the software that they update:

Script Name	WHM Feature	Description
<code>/usr/local/cpanel/scripts/rpmup2</code>	Update System Software	This script updates your system software. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">Note: This script is similar to the <code>yum update</code> command.</div>
<code>/usr/local/cpanel/scripts/sysup</code>	Update Server Software	This script updates software dependencies that the operating system provides and cPanel & WHM requires.
The <code>/usr/local/cpanel/scripts/*up</code> scripts	N/A	cPanel & WHM contains a number of scripts that update applications which cPanel & WHM installs. For a complete list of <code>*up</code> scripts, visit our WHM Scripts documentation.
