# Customization

***For cPanel & WHM version 60***

(*Home* >> *cPanel* >> *Customization*)

## Overview

This interface allows you to upload custom logos and a favicon, modify specific aspects of the cPanel interface, and upload custom cPanel styles.

> **Note:**
> You can download an example skeleton style to help you create a new style.

## Customize Branding

To use the *Customize Branding* tab to customize the cPanel or Webmail interfaces, perform the following steps:

1. To brand the interface with the name of your company, enter your company's name in the *Company Name* text box.
   - Use this option if you do not wish to upload a custom logo.
   - If you use this option, your company name will appear in the default cPanel font. To change the font style, you **must** customize cPanel's CSS via a custom style.
2. To customize the *Help* link, enter your help or support website URL in the *Help Link* text box. The *Help* link will **not** appear in the cPanel interface until you enter a custom URL.
3. To customize the *Documentation* link, enter your documentation website's URL in the *Documentation Link* text box. If you do not enter a custom *Documentation* link, the *Documentation* link points to cPanel's documentation website.
4. To customize your company logo, Webmail logo, or favicon, click *Browse* under the appropriate heading and select the desired file.

   > **Note:**
   > To delete an uploaded logo, click the trash can icon (
   >
   > 🗑
   >
   > ) for that image file.

5. To apply your changes, click *Save*.

## Customize Style

> **Note:**
> For more information about how to create your own cPanel style, read our Tutorial - Create a Custom cPanel Style and Guide to cPanel Interface Customization and Branding documentation.

### Upload a custom style

To upload custom cPanel styles, perform the following steps:

1. Click *Upload a Style.*
2. To select a style to upload, click *Browse*.
   - You **must** upload your custom style as a `.tar.gz` file, which **must** contain the `styles.css` file, the `styles.min.css` file, or both.
   - We **strongly** recommend that you include **both** the `styles.css` and `styles.min.css` files.

- The system uses the `.tar.gz` file's name as the style's name.
3. To set the style as the default style, select the *Set this style as my default style* checkbox.
4. Click *Upload*.

## Manage Styles

The *Manage Styles* section allows you to view available styles, set a style as the default style for newly-created accounts, download styles, and delete styles that you uploaded.

- To filter the list of styles, click the desired filter name.
- For each style that the interface displays, you can perform the following actions:
  - *Set as Default* — Click to set a style as the default style for your newly-created accounts.

    > **Note:**
    > This action **only** sets the default for new accounts that you create. It does **not** set the style for existing accounts on the server.

  - *Download Style* — Click to download the style. You may wish to download existing styles in order to customize them or use them as a base for new styles.
  - *Delete* — Click the trash can icon to delete a style, and then click *Delete* again to confirm the deletion. You can **only** perform this action on styles that you uploaded and own.

## File locations

cPanel & WHM stores branding information in the `reseller_info.json` file, which exists in either the `root` user's or reseller's `brand` directory .

- If the reseller who owns the account has specified custom branding information, the cPanel user sees the reseller's branding in the cPanel interface.
- If the reseller has **not** specified custom branding information, but the `root` user **has** specified custom branding information, the cPanel user sees the `root` user's branding in the cPanel interface.
- If neither the reseller nor the `root` user have specified custom branding information, the cPanel user does **not** see any customizations to the cPanel interface.

When you save your customizations through this interface, the system stores your items in the following directories:

| User | Item | File path | File name |
|------|------|-----------|-----------|
| Reseller<br><br>**Note:** `resellername` represents the reseller's username. | Favicon | `/home/resellername/var/cpanel/reseller/brand` | `favicon.ico` |
| | Logo | `/home/resellername/var/cpanel/reseller/brand` | `logo.png` **or** `logo.svg` |
| | Webmail logo | `/home/resellername/var/cpanel/reseller/brand` | `webmail.png` **or** `webmail.svg` |
| | Custom styles | `/home/resellername/var/cpanel/reseller/styled/stylename`<br><br>**Note:** `stylename` represents the style's name. For example, if you upload the `mystyle.tar.gz` file, the system stores the style's files in the `/home/resellername/var/cpanel/reseller/styled/mystyle` directory. | N/A |
| `root` | Favicon | `/var/cpanel/customizations/brand` | `favicon.ico` |

| Logo | /var/cpanel/customizations/brand | logo.png **or** logo.svg |
|------|----------------------------------|--------------------------|
| Webmail logo | /var/cpanel/customizations/brand | webmail.png **or** webmail.svg |
| Custom styles | /var/cpanel/customizations/styled/stylename<br><br>**Note:**<br>stylename represents the style's name. For example, if you upload the mystyle.tar.gz file, the system stores the style's files in the /var/cpanel/customizations/styled/mystyle directory. | N/A |

**Note:**
The system checks for a .svg logo first. If no .svg logo exists, the system uses the .png logo, if one exists.
