

# Install an RPM

For cPanel & WHM version 60

(Home >> Software >> Install an RPM)

- [Overview](#)
- [Install an RPM](#)
- [Additional documentation](#)

## Overview

RPM® (RPM Package Manager) refers to a software format, the software that the RPM package contains, and the package management system.

Your cPanel & WHM server includes a number of pre-installed RPMs, and the ability to install more. However, this interface allows you to install an RPM for the operating system distribution, which is separate from the cPanel-provided RPMs.

For more information about RPMs, visit [the RPM website](#).

**Note:**

The interface requires several seconds to load due to the number of RPMs on your server.

## Install an RPM

To install an RPM, perform the following steps:

1. From the *Select package to install* menu, select the RPM that you wish to install.
2. Click *Install*.
