

List Subdomains

(WHM >> Home >> Account Information >> List Subdomains)

Overview

Subdomains function as URLs for different sections of a website. For example, the `example.com` domain may contain the `documents.example.com` subdomain for its documentation section; this may be easier for visitors to remember than the `example.com/documents` domain.

List of subdomains

This interface displays a list of subdomains. Use the *Search* text box to search for a domain, user, subdomain, addon domain, or parked domain. You can also sort each column alphabetically.

- *Domain* — Displays the main domain for the subdomain.
- *User* — Displays the owner of the subdomain.
- *Subdomain* — Displays the domain name of the subdomain.
- *Addon or Parked Domain* — Displays the addon domain or parked domain (or alias), if the subdomain owns one. For more information about addon or parked domains (or aliases), read our [Addon Domains](#) or [Park a Domain](#) documentation.

You can click *Unpark* to remove an addon or parked domain.
