

# cPanel Web Disk Configuration

(WHM >> Home >> Service Configuration >> cPanel Web Disk Configuration)

- [Overview](#)
- [Defaults](#)
- [Edit the cipher list](#)
- [Edit the protocol list](#)
- [Additional resources](#)

## Overview

The system uses cipher suites to negotiate security settings for Web Disk network connections over TLS/SSL. This interface allows you to edit the TLS/SSL cipher and protocol lists for Web Disk.

### Warning:

As of cPanel & WHM version 68, we only support Transport Layer Security (TLS) protocol [version 1.2](#).

- We will only support applications that use [TLSv1.2](#).
- We **strongly** recommend that you enable [TLSv1.2](#) on your server.

### Important:

We recommend that **only** advanced users edit the cipher and protocol lists.

## Defaults

By default, cPanel & WHM uses the following cipher list for web services:

[Click to view...](#)

```
ECDHE-ECDSA-AES256-GCM-SHA384 : ECDHE-RSA-AES256-GCM-SHA384 : ECDHE-ECDSA-CHACHA20-POLY1305 : ECDHE-RSA-CHACHA20-POLY1305 : ECDHE-ECDSA-AES128-GCM-SHA256 : ECDHE-RSA-AES128-GCM-SHA256 : ECDHE-ECDSA-AES256-SHA384 : ECDHE-RSA-AES256-SHA384 : ECDHE-ECDSA-AES128-SHA256 : ECDHE-RSA-AES128-SHA256
```

By default, cPanel & WHM uses the following protocol list for web services:

[Click to view...](#)

```
SSLv23 : !SSLv2 : !SSLv3 : !TLSv1 : !TLSv1_2
```

## Edit the cipher list

To edit the *TLS/SSL Cipher List* value, perform the following steps:

1. Enter the appropriate cipher in the text box.

### Notes:

- The default cipher list is PCI compliant. To edit the cipher list to improve the security level on your server, read Apache's [SSLCipherSuite Directive](#) documentation.
- We do **not** recommend that you edit the cipher list to lower the security level. Make certain that the cipher suite uses **at least** 128-bit encryption.

2. Click Save.

## Edit the protocol list

To edit the *TLS/SSL Protocol* list, perform the following steps:

1. Enter the appropriate protocols in the text box.
2. Click *Save*.
