

Change Language

(cPanel >> Home >> Preferences >> Change Language)

Overview

You can choose to view the cPanel interface in many different languages.

Note:

When you change the interface's language, the system sets a cookie in your browser that expires after one year. You must perform this step each time that you log in to webmail from a new browser, whenever you delete cookies, and after the cookie expires.

Change the language

To change your cPanel interface's language, perform the following steps:

1. Select the language that you wish to use from the *Select a language* menu.
2. Click *Change*. The interface will refresh in the newly-selected language.

Notes:

- If your browser's `Accept-Language` header is set, the login interface will attempt to display the locale that corresponds to your browser setting. If the locale that the browser's header requests is not available, the login interface will appear in English.
- The *cPanel Snowmen* - `i_cpanel_snowmen` locale is **not** for general use. Theme customizers and third-party developers can use this locale to test cPanel & WHM's localization system against their customizations. For more information, or for help if you selected this theme accidentally, read our [The Snowman Locale](#) documentation.
