

FTP Server Selection

(WHM >> Home >> Service Configuration >> FTP Server Selection)

[Overview](#)

[How to select an FTP daemon](#)

[Pure-FTPd and ProFTPD](#)

[Additional documentation](#)

Overview

This interface allows you to select an FTP server daemon, or to disable FTP services.

Note:

When you upgrade a server for which the FTP RPM's target is set to `unmanaged`, problems may occur in the cPanel user interface. For more information, read our [How to Restore Missing FTP Interfaces in cPanel](#) documentation.

How to select an FTP daemon

To select an FTP daemon for your server, perform the following steps:

1. In the *FTP Server* column, select *ProFTPD* or *Pure-FTPd*.
 - Select *Disabled* to disable FTP services.
2. Click *Save*.

Pure-FTPd and ProFTPD

The following list offers comparisons between these FTP server daemons:

Note:

As of cPanel & WHM version 68, we only support Transport Layer Security (TLS) protocol [version 1.2](#). However, you can use [TLSv1.1](#) or [TLSv1.2](#) to manage your Pure-FTPd server.

- Pure-FTPd typically provides faster FTP transfers than ProFTPD.
- Pure-FTPd does not display statistics in the statistics menu.
- Pure-FTPd supports virtual user quotas; ProFTPD does not.
- ProFTPD will display your bandwidth usage, allowing you to monitor the amount of bandwidth that FTP sessions use.

For more information, visit the [ProFTPD](#) and [Pure-FTPd](#) websites.
