

Traceroute Enable Disable

For cPanel & WHM version 58

([Home](#) >> [Security Center](#) >> [Traceroute Enable/Disable](#))

[Overview](#)

[How to enable or disable traceroute](#)

[Traceroute file permissions](#)

Overview

Traceroute is a command-line network tool that determines the route that information packets travel across the Internet. This interface allows you to discover possible weaknesses that attackers might exploit, or to troubleshoot problems with the network.

Note:

The traceroute network tool is **not** related to cPanel's [Track Delivery](#) interface ([Home](#) >> [Email](#) >> [Track Delivery](#)).

How to enable or disable traceroute

Click [Enable](#) to enable traceroute, or click [Disable](#) to disable traceroute.

Traceroute is disabled by default.

Traceroute file permissions

The system uses the permissions of the `/bin/traceroute` file to determine whether traceroute is enabled or disabled:

- 755 indicates that traceroute is enabled.
- 700 indicates that traceroute is disabled.

Advanced users can change the permissions for the `/bin/traceroute` file manually; however, the interface may not indicate these changes.
