

Edit a Locale

For cPanel & WHM version 64

(Home >> Locales >> Edit a Locale)

[Overview](#)

[Locale Editor - Bulk Mode](#)

[Non-Standard Locale Configuration](#)

[Additional documentation](#)

Overview

Use this interface to edit the locales on your server.

Important:

After you use this interface, you **must** run the `/usr/local/cpanel/bin/build_locale_databases` script from the command line. If you do not run this script, your changes will **not** appear in the cPanel interface until the next time that the `upcp` script runs.

Note:

To edit a locale offline, download the locale file from WHM's [Locale XML Download](#) interface (Home >> Locales >> Local XML Download). After you make the desired changes, upload the file in WHM's [Locale XML Upload](#) interface (Home >> Locales >> Locale XML Upload).

Locale Editor - Bulk Mode

The *Bulk Mode* editor allows you to edit any of a locale's phrases.

To edit a locale's phrases, perform the following steps:

1. Select the desired locale from the *Locale* menu.

Note:

The *cPanel Snowmen - i_cpanel_snowmen* locale is **not** for general use. Theme customizers and third-party developers can use this locale to test cPanel & WHM's localization system against their customizations. For more information, or for help if you selected this theme accidentally, read our [The Snowman Locale](#) documentation.

2. Select a theme from the *Theme* menu.
3. Click *Go*. A new interface will display.
4. Click *Edit* under the phrase that you wish to edit.
5. Edit the phrase in the *Value* text box.
6. Click *Save Changes* to save your changes, or click *cancel* to cancel changes.

Note:

Click *Revert to Default Value* to undo changes or edits to a specific phrase.

Non-Standard Locale Configuration

This tool allows you to configure data for a non-standard locale. A non-standard locale is a language with no data in the [CLDR](#). The system adds the prefix `i_` to the names of these locales. These tags are standard ways to create, identify, and work with non-standard locales.

To configure a non-standard locale, perform the following steps:

1. Select a locale from the *Locale* menu and click *Go*.

Note:

The *cPanel Snowmen - i_cpanel_snowmen* locale is **not** for general use. Theme customizers and third-party developers can use this locale to test cPanel & WHM's localization system against their customizations. For more information, or for help if you selected this theme accidentally, read our [The Snowman Locale](#) documentation.

2. Enter a display name in the *Display Name* text box.

3. Select the fallback locale, number formatting, and character orientation from the appropriate menus.

Note:

When a non-standard locale's lexicon does not have a phrase, the system displays the fallback locale's phrase.

4. Click *Save*.
