Overview

This document describes how to install the Drush application, which allows you to manage Drupal, a popular content management system (CMS).

Important:

- You **must** add Drush on each project via the Composer application.
- We recommend that you only install Drush on servers with at **least** 4GB of memory or 2GB of memory with a 2GB swap space.
- cPanel accounts **must** possess access to SSH in order to use the Composer application.

Install Drush

1

Install Composer.

To install Composer, read our [How to Set Up \(PHP\) Composer](#) document.

2

Add Drush as a requirement to your project's composer.json file.

If you have not yet added Drush as a requirement to your project's `composer.json` file, run the following command:

```
composer require drush/drush
```

The system will return output similar to the following example:

```
- Installing drush/drush (9.3.0): Loading from cache
```

3

Install Drush.

To install Drush, run the following command:

```
composer install
```

The system will return output similar to the following example:

```
- Installing drush/drush (9.3.0): Loading from cache
```
