

# Rearrange an Account

(WHM >> Home >> Account Functions >> Rearrange an Account)

[Overview](#)  
[Rearrange an account](#)  
[Additional documentation](#)

## Overview

This interface allows you to change which home directory stores an account. You can use this feature when, for example, a hard drive begins to run out of space and your server contains an additional hard drive.

### Warning:

If a script relies on a hardcoded path to a resource that you move, you **must** update that path to use the new location or the script will fail.

## Rearrange an account

To change an account's hard drive, perform the following steps:

1. Select a domain from the *Domains* menu or select a user from the *Users* menu.
2. Click *Rearrange*.
3. Select the home directory in which you wish to store the account.

### Notes:

The new home directory **must** exist in one of the following settings in WHM's [Basic WebHost Manager Setup](#) interface (*WHM >> Home >> Server Configuration >> Basic WebHost Manager Setup*):

- *Additional home directories matching the following value will also be used for new home directory creations.*
- *Enter the location where you wish for new users' home directories to be created. settings*

4. Click *Move Account*.
