Overview

cPanel-provided statistics software supports a variety of languages. If the software's default map of locales to languages does not fit your customers' needs, the *Application Locale Configuration* interface allows you to customize the language in which the system displays a customer's preferred locale. For example, you can associate the cPanel locale option *fr* with the Webalizer option *french*. This will ensure that cPanel users who choose the French language setting in cPanel view the Webalizer statistics software in French.

To update the list of locales on the system, click *rebuild the locale databases* at the bottom of the interface.

Application Locale Configuration

To change your application locale configuration, perform the following steps:

1. Select a value from the *Analog* menu.
2. Select a value from the *Awstats* menu.
3. Select a value from the *Webalizer* menu.
4. Click *Save*.

Note:

The system will not implement the changes that you make to the applications' locale configurations until after the next statistics update.
