Overview

This feature allows you to update your cPanel & WHM software to the most recent build available on your server's Release Tier.

For example, if you selected the CURRENT tier in WHM's [Update Preferences](#) interface (Home >> Server Configuration >> Update Preferences), then this feature will upgrade your server to the latest CURRENT build.

Additional software updates

The script that this feature runs (`/usr/local/cpanel/scripts/upcp`) calls other scripts in the `/usr/local/cpanel/scripts` directory that will update most of the software on your system.

The following table lists the additional scripts and the software that they update:

Script Name	WHM Feature	Description
<code>/usr/local/cpanel/scripts/rpmup2</code>	Update System Software	This script updates your system software. <div style="border: 1px solid #ffc107; padding: 5px; margin-top: 10px;"> Note: This script is similar to the <code>yum update</code> command.</div>
<code>/usr/local/cpanel/scripts/sysup</code>	Update Server Software	This script updates software dependencies that the operating system provides and cPanel & WHM requires.
The <code>/usr/local/cpanel/scripts/*up</code> scripts	N/A	There are a number of scripts that update applications that are installed with cPanel. For a complete list of <code>*up</code> scripts, visit our WHM Scripts documentation.

Send Update Analysis to cPanel

This feature sends a log file from your update attempt to cPanel so that we can improve the quality of our software and the update process.

Forced Reinstall

This feature allows you to force a reinstall of the cPanel & WHM software, regardless of whether WHM detects that your system is up-to-date. This can be useful if any files are corrupt and you wish to reinstall them.

How to update your cPanel & WHM software

To update your cPanel & WHM software, perform the following steps:

1. If you wish to send cPanel the log files from your update attempt, click the appropriate checkbox.
 - If you wish to disable this option, disable the *Send information about server usage to cPanel for analysis* option in WHM's [Tweak Settings](#) interface (Home >> Server Configuration >> Tweak Settings).
2. If you wish to force a reinstall of the software, select the appropriate checkbox.
3. Click *Click to Upgrade*.

Notes:

- If you use Safari® on iPad, the browser may display text that is too small to read. To adjust the text size, use the iPad's zoom gesture.
- You can also run the `/scripts/upcp` script via the command line as the `root` user.
