

List Subdomains

For cPanel & WHM version 62

([Home](#) >> [Account Information](#) >> [List Subdomains](#))

Overview

Subdomains function as URLs for different sections of a website. For example, `example.com` may have the subdomain `documents.example.com` for its documentation section; this may be easier for visitors to remember than `example.com/documents`.

List of subdomains

This feature is a list of subdomains.

- *Domain* — Displays the main domain with which the subdomain is associated.
- *User* — Displays the owner of the subdomain.
- *Subdomain* — Displays the domain name of the subdomain.
- *Addon Domain* — Displays the addon domain, if the subdomain has one. An addon domain will redirect incoming traffic to the subdomain that is associated with it.

You can click *UnPark* to remove a subdomain or addon domain.
